Project Details

The Project was consisted of following tasks.:

- Data wrangling: which consists of: Gathering data, Assessing data and Cleaning data.
- Storing: which consists of analyzing, and visualizing your wrangled data

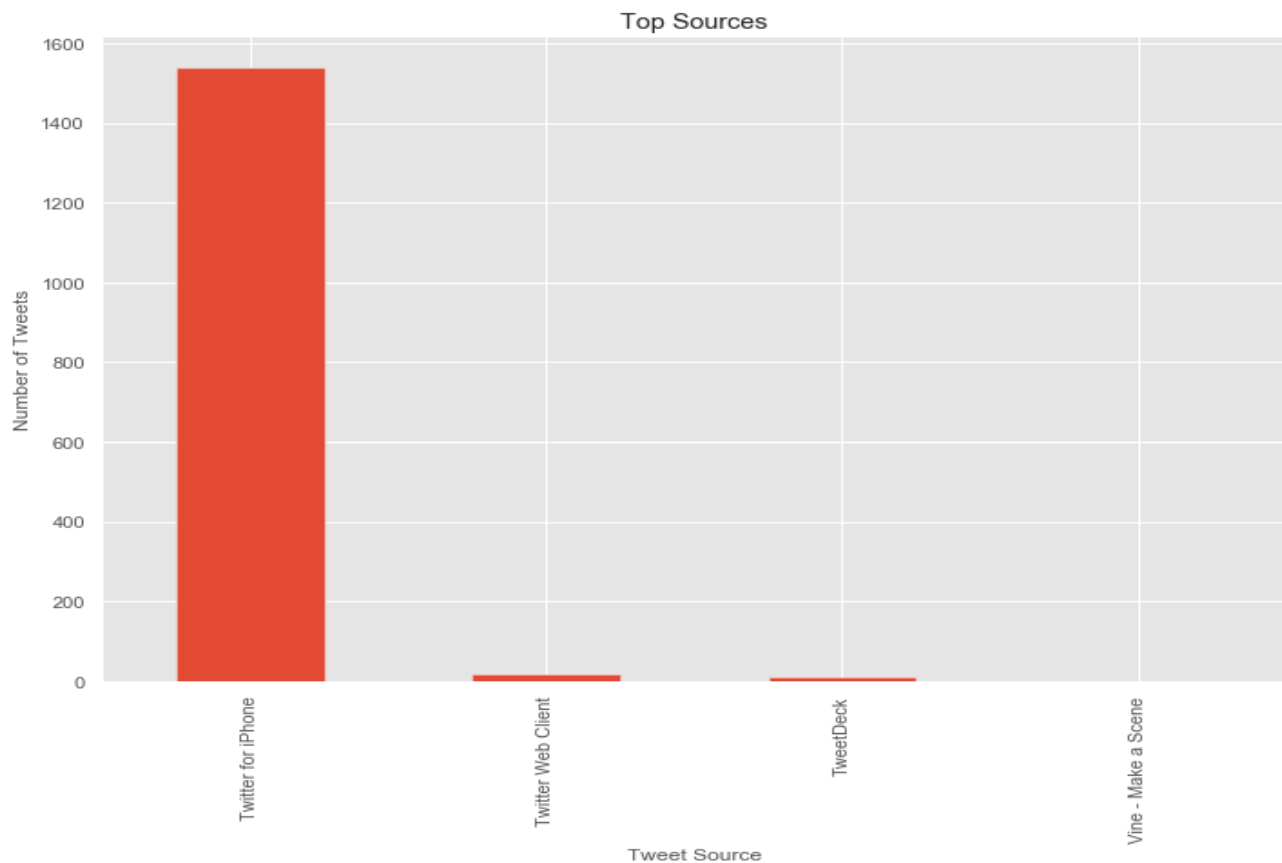

Reporting on:

- 1) Data wrangling efforts
- 2) Data analyses and visualizations

As we know all the steps are important but without visualization it is going to be a story which stops just before the climax. Visualization is important for getting insight of data and telling the story completely.

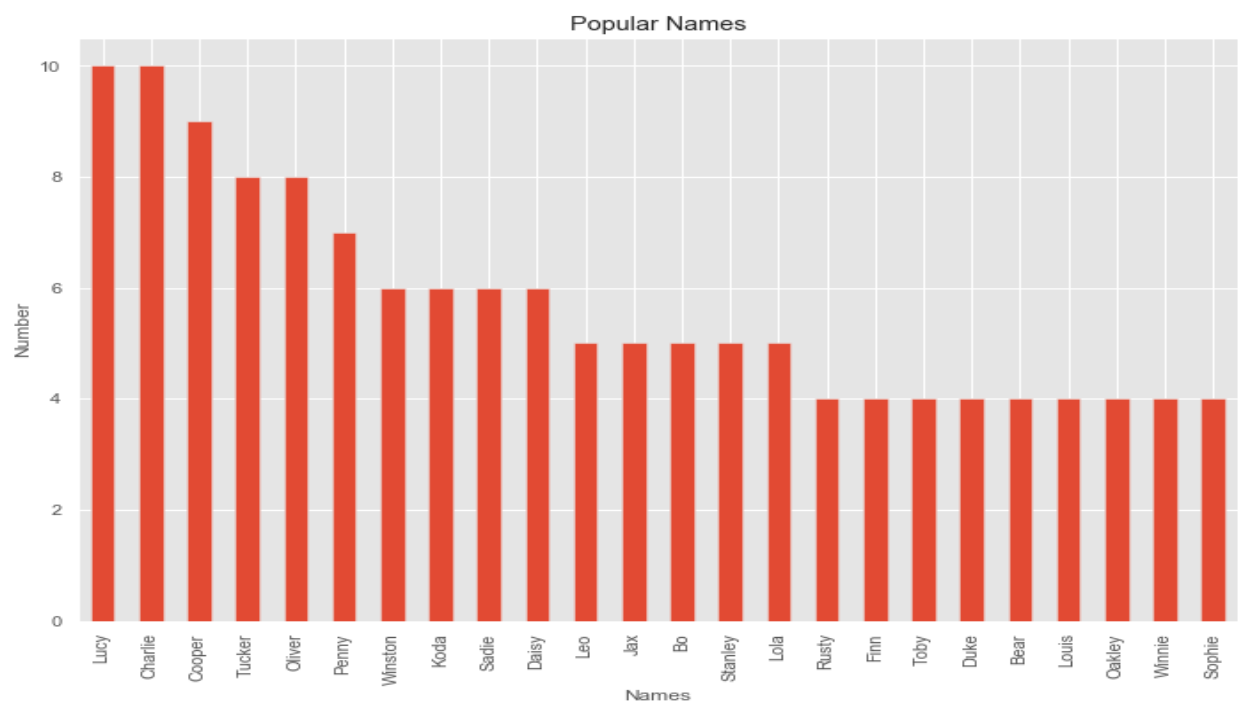

After performing all the steps of data wrangling we moved towards the visualization to present the findings.

The people mostly tweeted from Iphone. We can see the result in the figure below.

This might tell us that people are mostly using their smart phones for Tweeting on this page. Very few are using other sources.

Sometimes Dog names are personal, people named them using a name which they like or when something is associated with it. All the names available in database we wanted to see which are mostly used names.

Database also ranks the dogs and we show how dogs are rated and How many are below average or above average.
